According to our (LP Info Research) latest study, the global Chest Electromagnetic Navigation System market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the Chest Electromagnetic Navigation System is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global Chest Electromagnetic Navigation System market. With recovery from influence of COVID-19 and the Russia-Ukraine War, Chest Electromagnetic Navigation System are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of Chest Electromagnetic Navigation System. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Chest Electromagnetic Navigation System market.

The chest electromagnetic navigation system is a new generation of 4D electromagnetic navigation positioning diagnosis and treatment technology that integrates electromagnetic positioning technology, virtual bronchoscopy, three-dimensional CT imaging technology, and endoscopic images. It uses chest CT data during deep breathing before surgery as a reconstruction model, and prepares a navigation planning road map before surgery. During the operation, the respiratory movement of the patient can also be detected. After bronchoscopic navigation and positioning, it can be matched and mapped with the preoperative planning map, and the position of the lesion can be

synchronized with the patient's respiratory movement, greatly improving the accuracy of navigation. The tip of each puncture needle or biopsy forceps is embedded with a navigation probe, which can be connected to the device in real time, projected, and display the real-time position; it can not only perform percutaneous puncture positioning, but also find lesions in all directions and multiple projection angles for accurate puncture , the lesion is injected with dye to guide the surgical resection; it can also be navigated through the airway. If a transtracheal biopsy is performed, it can enter a more slender bronchus, reach a position that was previously impossible to reach with a bronchoscope, and more accurately reach the puncture site for a biopsy. If radiofrequency ablation is required, it can be selected through the airway or percutaneously, neither of which requires CT irradiation, so as to avoid the long-term radiation status of CT detection during the previous operation.
