Chillers for electronics are high-precision refrigeration equipment designed specifically for temperature control requirements during electronics manufacturing and testing. They are widely used in semiconductor packaging, PCB drilling, laser cutting, chip testing, electroplating, power supply equipment cooling, and other links. The chiller uses a built-in compressor refrigeration system to control the coolant temperature within a set range and circulate it to the cooling part of the equipment, effectively removing the heat generated during the production process to ensure stable operation of the equipment and product accuracy. At the same time, it uses high-efficiency heat exchangers, low-noise fans and intelligent temperature control systems to ensure stable system operation, energy saving and high efficiency.
