The basic principle of chimeric antigen receptor T cell immunotherapy is to use the patient's own immune cells to eliminate cancer cells. Among them, chimeric antigen receptor (CAR) is the core component of CAR-T, giving T cells HLA-independent recognition. The ability of tumor antigens, which enables CAR-modified T cells to recognize a wider range of targets than the natural T cell surface receptor TCR. The basic design of CAR includes a tumor-associated antigen (TAA) binding region (usually derived from the scFV segment of the monoclonal antibody antigen binding region), an extracellular hinge region, a transmembrane region and an intracellular signal Area
