Abstracts

The global Chip Security Verification Software market size is predicted to grow from US\$ 303 million in 2025 to US\$ 792 million in 2032; it is expected to grow at a CAGR of 14.8% from 2026 to 2032.

Chip Security Verification Software refers to specialized software tools and software-centric platforms used to identify, analyze, verify, and document security weaknesses in semiconductor chips, systems-on-chip, processors, hardware IP, cryptographic implementations, and hardware–firmware interfaces. The market primarily covers EDA-integrated security verification modules, standalone verification software, security analysis workstation software, commercially supported open-source toolchains, and integrated test platforms in which proprietary software controls experiments and analyzes results. Core technical functions include formal security-property verification, secure access-path analysis, information-flow and taint tracking, simulation-based attack validation, side-channel leakage analysis, fault-injection analysis, security-coverage measurement, root-cause localization, and generation of auditable verification evidence. Chip Security Verification Software is applied across pre-silicon design, emulation and prototyping, post-silicon device evaluation, and cross-lifecycle verification workflows, supporting security validation for roots of trust, secure boot, access control, isolation mechanisms, cryptographic modules, debug and test interfaces, sensitive-data flows, and resistance to physical attacks.

Key Findings

The confirmed core supplier pool contains 16 parent-company-level software and platform vendors

North America and Europe host 14 of the 16 confirmed core suppliers

Pre-silicon formal and information-flow verification forms the broadest commercial product group

Enterprise licensing and integrated platforms make shipment volume and ASP structurally non-comparable

Market Trends

Chip Security Verification Software is moving from predominantly post-silicon laboratory assessment toward earlier and more continuous verification across architecture, RTL, netlist, emulation, and physical-design stages. Formal security checking, information-flow tracking, and pre-silicon side-channel analysis increasingly aim to identify root causes before tape-out, when corrective design changes are less disruptive. Product development is also shifting from isolated vulnerability detection toward measurable security coverage, repeatable sign-off workflows, hardware–firmware co-verification, and traceable evidence that can be reused during product assurance and certification. Commercial tools now combine automated access-path verification, leakage localization, attack-scenario generation, and correlation between simulated and fabricated devices. This direction is reinforced by the increasing complexity of chiplets, AI accelerators, shared SoC resources, secure processors, and cryptographic implementations, which create security relationships that are difficult to assess through manual review or post-silicon testing alone. Official product portfolios from major EDA and device-security suppliers demonstrate the continued expansion of security verification into established semiconductor development workflows.

Market Dynamics

Drivers

Market demand is being driven by the rising economic and operational impact of hardware vulnerabilities, the increasing use of complex SoCs in connected and mission-critical systems, and the need to detect weaknesses before manufacturing. Security teams must evaluate isolation, access permissions, sensitive-data propagation, debug functions, cryptographic leakage, and resilience to voltage, clock, electromagnetic, and laser-based attacks. The 2025 CWE Most Important Hardware Weaknesses list highlights issues involving improper isolation of shared SoC resources, insecure debug and test interfaces, override of hardware locks, and insufficient protection against

voltage and clock glitches, strengthening the case for systematic design-stage verification. Regulatory and product-assurance requirements are also increasing demand for structured, reproducible, and auditable security evidence.

Restraints

Adoption remains constrained by the specialist knowledge required to model hardware attack surfaces, define meaningful security properties, interpret formal results, and connect physical leakage or injected faults to their RTL-level causes. Enterprise EDA contracts frequently bundle security functions with broader simulation and formal-verification platforms, limiting revenue transparency and making purchasing decisions dependent on existing tool environments. Specialist platforms may also require integration with simulators, emulators, laboratory instruments, design databases, firmware environments, and certification processes. Long verification cycles, limited availability of experienced hardware-security engineers, and the cost of building representative attack models can delay deployment among smaller semiconductor companies. Internally developed tools and open-source frameworks further reduce the addressable commercial market for standardized products.

Opportunities

The strongest opportunities lie in shifting security analysis left into chip architecture and RTL development, extending verification from individual security blocks to complete SoCs, and connecting pre-silicon predictions with post-silicon measurements. Chiplet architectures, heterogeneous integration, RISC-V processors, AI accelerators, automotive domain controllers, hardware roots of trust, and post-quantum cryptographic implementations require scalable methods for validating permissions, isolation, data movement, and physical attack resistance. Opportunities also exist in automated mapping of design findings to hardware weakness taxonomies, generation of security-coverage metrics, and production of reusable assurance evidence. GlobalPlatform's SESIP methodology supports structured component and platform evaluation and enables composition and reuse of security evidence, creating additional demand for tools that integrate verification results into repeatable assurance workflows.

Challenges

The industry faces persistent challenges in standardizing product boundaries, verification metrics, license units, and the relationship between design verification, penetration testing, certification, and security consulting. A result generated by one tool

may not be directly comparable with evidence generated through another methodology, particularly across formal verification, simulation, side-channel testing, and fault injection. False confidence is another risk: proving selected properties or detecting known weakness patterns does not demonstrate that a chip is free from all exploitable vulnerabilities. Vendors must continually update attack libraries, device models, verification engines, and integrations as architectures evolve. The market also remains exposed to consolidation, as larger EDA, semiconductor IP, and test-platform groups can acquire specialist capabilities and bundle them into broader product portfolios. Arteris completed its acquisition of Cyscuity in January 2026, illustrating this integration trend.

Value Chain Analysis

The upstream layer of the Chip Security Verification Software value chain comprises formal-verification algorithms, simulation and emulation infrastructure, hardware-description languages, design databases, cloud and high-performance computing resources, vulnerability taxonomies, attack models, and interfaces to measurement or fault-injection instruments. These inputs determine verification capacity, scalability, coverage, and interoperability. High-value upstream capabilities are concentrated in formal engines, information-flow analysis, physical leakage modeling, automated root-cause localization, and reusable security-property libraries. Standards and weakness classifications also influence product development by defining the security evidence, vulnerability categories, and evaluation outputs expected by development and assurance teams.

The midstream layer consists of integrated EDA suppliers, independent security-verification software developers, commercially supported open-source tool providers, and software-centric test-platform companies. Value is created by converting complex attack models and verification techniques into repeatable engineering workflows, reducing manual analysis, locating vulnerabilities earlier, and producing evidence suitable for design reviews and assurance programs. Research and development, specialist engineering personnel, software maintenance, platform integration, and customer support represent the principal cost components. Standalone software and enterprise licenses offer software-oriented margin potential and recurring maintenance revenue, while integrated physical-test platforms carry higher hardware, laboratory, and application-support costs. The downstream value is realized by semiconductor and IP developers, security laboratories, device manufacturers, and system companies through reduced redesign risk, lower probability of certification failure, shorter security-debug cycles, and stronger evidence of product assurance.

Segment Insights

By product type, EDA-integrated security verification modules form the broadest commercial group because they can be deployed within established simulation, formal-verification, debug, and enterprise-license environments. Standalone security-verification software and security analysis workstations form a smaller but technically differentiated segment, particularly in information-flow verification, hardware weakness detection, side-channel analysis, and fault-injection assessment. Software-centric integrated test platforms remain important for post-silicon and cross-lifecycle workflows, while commercially supported open-source toolchains serve research, education, evaluation laboratories, and cost-sensitive engineering teams.

By verification stage, pre-silicon security verification represents the principal structured software opportunity, supported by formal property checking, secure-path verification, information-flow analysis, and simulation-based attack validation. Cross-lifecycle verification is emerging as an important growth direction because it links design-stage findings with measurements from fabricated devices. By core verification method, formal verification has the strongest integration with mainstream EDA workflows, while side-channel and fault-injection analysis retain higher specialist barriers. The most attractive application areas include root-of-trust and secure-boot verification, access-control and isolation analysis, sensitive-data-flow verification, cryptographic implementation security, debug-interface protection, and physical attack resistance.

Downstream Market Opportunities

Semiconductor and hardware IP development remains the central commercial application because security weaknesses introduced at architecture or RTL level can propagate across multiple products and customers. Automotive electronics, data-center and AI computing, aerospace and defense, payment and identity systems, secure elements, and connected industrial or consumer devices provide additional opportunities due to their reliance on protected execution, secure boot, cryptographic operations, trusted data movement, and long product lifecycles. Emerging demand is increasingly associated with systems that combine complex hardware with updateable firmware and third-party IP, where component-level assurance must be preserved after system integration. Regulatory preparation and reusable certification evidence can further increase adoption among companies supplying products with digital elements. The European Union's Cyber Resilience Act reporting obligations are scheduled to apply from September 11, 2026, while its principal product obligations will apply from

December 11, 2027.

Regional Insights

North America represents the leading regional market and supply center for Chip Security Verification Software, supported by its concentration of major EDA platforms, semiconductor IP companies, specialist hardware-security software developers, AI and data-center chip programs, and aerospace and defense demand. Ten of the 16 confirmed core parent-company suppliers are headquartered in North America. The region has the strongest commercial position in formal security verification, information-flow analysis, static hardware-security sign-off, security test generation, and enterprise software integration.

Europe is the second major supply cluster, with particular strength in formal verification, side-channel analysis, fault-injection assessment, and structured security evaluation. Four confirmed core suppliers are headquartered in Europe, while France has developed a distinctive concentration of physical-attack and security-evaluation capabilities. The European regulatory and assurance environment is expected to support demand for traceable verification evidence. Asia-Pacific is the most important expansion opportunity: China has established local suppliers of software-driven chip-security test platforms, while Japan, South Korea, and Taiwan combine substantial semiconductor production and design activity with comparatively limited independent specialist software supply. GlobalPlatform has also reported initiatives aligning Taiwan's semiconductor ecosystem with SESIP requirements, supporting greater use of internationally reusable security-assurance evidence.

Competitive Landscape Analysis

The competitive landscape is structured around three supplier groups rather than a single uniform ranking. Large integrated EDA companies hold the strongest position in pre-silicon verification because their security applications operate inside widely adopted formal, simulation, debug, and sign-off environments. Scaled device-security and semiconductor-assurance platforms compete through broader coverage of information-flow analysis, side-channel assessment, fault injection, and correlation between design-stage and physical-device results. Specialized independent vendors differentiate through hardware-security sign-off, security test synthesis, automated weakness detection, processor-focused formal analysis, or lower-cost open toolchains. Competitive advantage depends less on license price alone than on verification capacity, attack-model depth, integration with established design environments, root-

cause accuracy, measurable coverage, and the ability to produce auditable evidence. Market consolidation is likely to continue as EDA, system-IP, and electronic-test groups seek to add specialist security capabilities. The acquisition of Cycuity by Arteris demonstrates the strategic value of integrating semiconductor security assurance with broader SoC design and connectivity platforms, while the continued development of dedicated formal-security and pre-silicon leakage-analysis products indicates that security verification is becoming a more identifiable component of semiconductor engineering expenditure.

Report Scope

LPI (LP Information)' newest research report, the “Chip Security Verification Software Industry Forecast” looks at past sales and reviews total world Chip Security Verification Software sales in 2025, providing a comprehensive analysis by region and market sector of projected Chip Security Verification Software sales for 2026 through 2032. With Chip Security Verification Software sales broken down by region, market sector and sub-sector, this report provides a detailed analysis in US\$ millions of the world Chip Security Verification Software industry.

This Insight Report provides a comprehensive analysis of the global Chip Security Verification Software landscape and highlights key trends related to product segmentation, company formation, revenue, and market share, latest development, and M&A activity. This report also analyses the strategies of leading global companies with a focus on Chip Security Verification Software portfolios and capabilities, market entry strategies, market positions, and geographic footprints, to better understand these firms' unique position in an accelerating global Chip Security Verification Software market.

This Insight Report evaluates the key market trends, drivers, and affecting factors shaping the global outlook for Chip Security Verification Software and breaks down the forecast by Type, by Application, geography, and market size to highlight emerging pockets of opportunity. With a transparent methodology based on hundreds of bottom-up qualitative and quantitative market inputs, this study forecast offers a highly nuanced view of the current state and future trajectory in the global Chip Security Verification Software.

This report presents a comprehensive overview, market shares, and growth opportunities of Chip Security Verification Software market by product type, application, key players and key regions and countries.

Market Segmentation

Segmentation by Type:

EDA-Integrated Security Verification Module

Standalone Security Verification Software

Security Analysis Workstation Software

Software-Centric Integrated Test Platform

Commercially Supported Open-Source Toolchain

Other

Segmentation by Verification Stage:

Pre-Silicon Security Verification

Cross-Lifecycle Security Verification

Other

Segmentation by Core Verification Method:

Formal Security Verification

Side-Channel Analysis

Fault-Injection Analysis

Other

Segmentation by Deployment Model:

Local Workstation Deployment

Private Cloud Deployment

Public Cloud or SaaS Deployment

Other

Segmentation by Application:

Root of Trust and Secure Boot Verification

Access Control and Isolation Verification

Sensitive Data-Flow Verification

Cryptographic Security Verification

Debug and Test Interface Security Verification

Physical Attack Resistance Verification

Other

This report also splits the market by region:

Americas

United States

Canada

Mexico

Brazil

APAC

China

Japan

Korea

Southeast Asia

India

Australia

Europe

Germany

France

UK

Italy

Russia

Middle East & Africa

Egypt

South Africa

Israel

Turkey

GCC Countries

The below companies that are profiled have been selected based on inputs gathered from primary experts and analyzing the company's coverage, product portfolio, its market penetration.

Siemens AG

Synopsys, Inc.

Keysight Technologies, Inc.

Cadence Design Systems, Inc.

Rambus Inc.

Arteris, Inc.

Secure-IC S.A.S.

Real Intent, Inc.

eShard SAS

Breker Verification Systems, Inc.

FortifyIQ, Inc.

lowRISC C.I.C.

Caspia Technologies

Silicon Assurance

OSR

DPLS Lab

1 SCOPE OF THE REPORT

- 1.1 Market Introduction
- 1.2 Years Considered
- 1.3 Research Objectives
- 1.4 Market Research Methodology
- 1.5 Research Process and Data Source
- 1.6 Economic Indicators
- 1.7 Currency Considered
- 1.8 Market Estimation Caveats

2 EXECUTIVE SUMMARY

- 2.1 World Market Overview
 - 2.1.1 Global Chip Security Verification Software Market Size (2021-2032)
 - 2.1.2 Chip Security Verification Software Market Size CAGR by Region (2021 VS 2025 VS 2032)
 - 2.1.3 World Current & Future Analysis for Chip Security Verification Software by Country/Region (2021, 2025 & 2032)
- 2.2 Chip Security Verification Software Segment by Type
 - 2.2.1 EDA-Integrated Security Verification Module
 - 2.2.2 Standalone Security Verification Software
 - 2.2.3 Security Analysis Workstation Software
 - 2.2.4 Software-Centric Integrated Test Platform
 - 2.2.5 Commercially Supported Open-Source Toolchain
 - 2.2.6 Other
 - 2.2.7 Chip Security Verification Software Market Size by Type
 - 2.2.7.1 Chip Security Verification Software Market Size CAGR by Type (2021 VS 2025 VS 2032)
 - 2.2.7.2 Global Chip Security Verification Software Market Size Market Share by Type (2021-2026)
- 2.3 Chip Security Verification Software Segment by Verification Stage
 - 2.3.1 Pre-Silicon Security Verification
 - 2.3.2 Cross-Lifecycle Security Verification
 - 2.3.3 Other
 - 2.3.4 Chip Security Verification Software Market Size by Verification Stage
 - 2.3.4.1 Chip Security Verification Software Market Size CAGR by Verification Stage

(2021 VS 2025 VS 2032)

2.3.4.2 Global Chip Security Verification Software Market Size Market Share by Verification Stage (2021-2026)

2.4 Chip Security Verification Software Segment by Core Verification Method

2.4.1 Formal Security Verification

2.4.2 Side-Channel Analysis

2.4.3 Fault-Injection Analysis

2.4.4 Other

2.4.5 Chip Security Verification Software Market Size by Core Verification Method

2.4.5.1 Chip Security Verification Software Market Size CAGR by Core Verification Method (2021 VS 2025 VS 2032)

2.4.5.2 Global Chip Security Verification Software Market Size Market Share by Core Verification Method (2021-2026)

2.5 Chip Security Verification Software Segment by Deployment Model

2.5.1 Local Workstation Deployment

2.5.2 Private Cloud Deployment

2.5.3 Public Cloud or SaaS Deployment

2.5.4 Other

2.5.5 Chip Security Verification Software Market Size by Deployment Model

2.5.5.1 Chip Security Verification Software Market Size CAGR by Deployment Model (2021 VS 2025 VS 2032)

2.5.5.2 Global Chip Security Verification Software Market Size Market Share by Deployment Model (2021-2026)

2.6 Chip Security Verification Software Segment by Application

2.6.1 Root of Trust and Secure Boot Verification

2.6.2 Access Control and Isolation Verification

2.6.3 Sensitive Data-Flow Verification

2.6.4 Cryptographic Security Verification

2.6.5 Debug and Test Interface Security Verification

2.6.6 Physical Attack Resistance Verification

2.6.7 Other

2.6.8 Chip Security Verification Software Market Size by Application

2.6.8.1 Chip Security Verification Software Market Size CAGR by Application (2021 VS 2025 VS 2032)

2.6.8.2 Global Chip Security Verification Software Market Size Market Share by Application (2021-2026)

3 CHIP SECURITY VERIFICATION SOFTWARE MARKET SIZE BY PLAYER

- 3.1 Chip Security Verification Software Market Size Market Share by Player
 - 3.1.1 Global Chip Security Verification Software Revenue by Player (2021-2026)
 - 3.1.2 Global Chip Security Verification Software Revenue Market Share by Player (2021-2026)
- 3.2 Global Chip Security Verification Software Key Players Head office and Products Offered
- 3.3 Market Concentration Rate Analysis
 - 3.3.1 Competition Landscape Analysis
 - 3.3.2 Concentration Ratio (CR3, CR5 and CR10) & (2024-2026)
- 3.4 New Products and Potential Entrants
- 3.5 Mergers & Acquisitions, Expansion

4 CHIP SECURITY VERIFICATION SOFTWARE BY REGION

- 4.1 Chip Security Verification Software Market Size by Region (2021-2026)
- 4.2 Global Chip Security Verification Software Annual Revenue by Country/Region (2021-2026)
- 4.3 Americas Chip Security Verification Software Market Size Growth (2021-2026)
- 4.4 APAC Chip Security Verification Software Market Size Growth (2021-2026)
- 4.5 Europe Chip Security Verification Software Market Size Growth (2021-2026)
- 4.6 Middle East & Africa Chip Security Verification Software Market Size Growth (2021-2026)

5 AMERICAS

- 5.1 Americas Chip Security Verification Software Market Size by Country (2021-2026)
- 5.2 Americas Chip Security Verification Software Market Size by Type (2021-2026)
- 5.3 Americas Chip Security Verification Software Market Size by Application (2021-2026)
- 5.4 United States
- 5.5 Canada
- 5.6 Mexico
- 5.7 Brazil

6 APAC

- 6.1 APAC Chip Security Verification Software Market Size by Region (2021-2026)
- 6.2 APAC Chip Security Verification Software Market Size by Type (2021-2026)
- 6.3 APAC Chip Security Verification Software Market Size by Application (2021-2026)

- 6.4 China
- 6.5 Japan
- 6.6 South Korea
- 6.7 Southeast Asia
- 6.8 India
- 6.9 Australia

7 EUROPE

- 7.1 Europe Chip Security Verification Software Market Size by Country (2021-2026)
- 7.2 Europe Chip Security Verification Software Market Size by Type (2021-2026)
- 7.3 Europe Chip Security Verification Software Market Size by Application (2021-2026)
- 7.4 Germany
- 7.5 France
- 7.6 UK
- 7.7 Italy
- 7.8 Russia

8 MIDDLE EAST & AFRICA

- 8.1 Middle East & Africa Chip Security Verification Software by Region (2021-2026)
- 8.2 Middle East & Africa Chip Security Verification Software Market Size by Type (2021-2026)
- 8.3 Middle East & Africa Chip Security Verification Software Market Size by Application (2021-2026)
- 8.4 Egypt
- 8.5 South Africa
- 8.6 Israel
- 8.7 Turkey
- 8.8 GCC Countries

9 MARKET DRIVERS, CHALLENGES AND TRENDS

- 9.1 Market Drivers & Growth Opportunities
- 9.2 Market Challenges & Risks
- 9.3 Industry Trends

10 GLOBAL CHIP SECURITY VERIFICATION SOFTWARE MARKET FORECAST

- 10.1 Global Chip Security Verification Software Forecast by Region (2027-2032)
 - 10.1.1 Global Chip Security Verification Software Forecast by Region (2027-2032)
 - 10.1.2 Americas Chip Security Verification Software Forecast
 - 10.1.3 APAC Chip Security Verification Software Forecast
 - 10.1.4 Europe Chip Security Verification Software Forecast
 - 10.1.5 Middle East & Africa Chip Security Verification Software Forecast
- 10.2 Americas Chip Security Verification Software Forecast by Country (2027-2032)
 - 10.2.1 United States Market Chip Security Verification Software Forecast
 - 10.2.2 Canada Market Chip Security Verification Software Forecast
 - 10.2.3 Mexico Market Chip Security Verification Software Forecast
 - 10.2.4 Brazil Market Chip Security Verification Software Forecast
- 10.3 APAC Chip Security Verification Software Forecast by Region (2027-2032)
 - 10.3.1 China Chip Security Verification Software Market Forecast
 - 10.3.2 Japan Market Chip Security Verification Software Forecast
 - 10.3.3 Korea Market Chip Security Verification Software Forecast
 - 10.3.4 Southeast Asia Market Chip Security Verification Software Forecast
 - 10.3.5 India Market Chip Security Verification Software Forecast
 - 10.3.6 Australia Market Chip Security Verification Software Forecast
- 10.4 Europe Chip Security Verification Software Forecast by Country (2027-2032)
 - 10.4.1 Germany Market Chip Security Verification Software Forecast
 - 10.4.2 France Market Chip Security Verification Software Forecast
 - 10.4.3 UK Market Chip Security Verification Software Forecast
 - 10.4.4 Italy Market Chip Security Verification Software Forecast
 - 10.4.5 Russia Market Chip Security Verification Software Forecast
- 10.5 Middle East & Africa Chip Security Verification Software Forecast by Region (2027-2032)
 - 10.5.1 Egypt Market Chip Security Verification Software Forecast
 - 10.5.2 South Africa Market Chip Security Verification Software Forecast
 - 10.5.3 Israel Market Chip Security Verification Software Forecast
 - 10.5.4 Turkey Market Chip Security Verification Software Forecast
- 10.6 Global Chip Security Verification Software Forecast by Type (2027-2032)
- 10.7 Global Chip Security Verification Software Forecast by Application (2027-2032)
 - 10.7.1 GCC Countries Market Chip Security Verification Software Forecast

11 KEY PLAYERS ANALYSIS

- 11.1 Siemens AG
 - 11.1.1 Siemens AG Company Information
 - 11.1.2 Siemens AG Chip Security Verification Software Product Offered

11.1.3 Siemens AG Chip Security Verification Software Revenue, Gross Margin and Market Share (2021-2026)

11.1.4 Siemens AG Main Business Overview

11.1.5 Siemens AG Latest Developments

11.2 Synopsys, Inc.

11.2.1 Synopsys, Inc. Company Information
