The chip transformer is a miniaturized, high-performance electronic component. It uses modern electronic manufacturing technology to wind a coil on an iron core, and encapsulates the iron core and coil in a plastic shell to form a complete electrical component. This kind of transformer is usually used in power supply, communication, audio and other fields. It has the advantages of high efficiency, low magnetic leakage, strong EMI suppression capability, etc., making it more reliable and economical than traditional large transformers. The working principle of the chip transformer is similar to other transformers. When the alternating current passes through the input coil, a magnetic field is generated on the iron core and an electromotive force is induced in the output coil, thereby determining the output voltage.

The global Chip Transformer market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
