The global Chiral Cyclobutane market size is predicted to grow from US\$ 145 million in 2025 to US\$ 226 million in 2032; it is expected to grow at a CAGR of 6.6% from 2026 to 2032.

Chiral cyclobutane refers to cyclobutane derivatives in which the four-membered ring contains one or more stereogenic centers, leading to non-superimposable mirror images (enantiomers) with distinct spatial configurations and often different biological or physicochemical properties; these compounds are especially important as intermediates in pharmaceuticals, agrochemicals, and fine chemicals where stereochemistry directly affects activity and selectivity. The supply chain begins upstream with petrochemical or bio-based feedstocks such as olefins (e.g., ethylene, propylene, or substituted alkenes), which undergo cyclization reactions (e.g., [2+2] cycloaddition, photochemical reactions, or metal-catalyzed processes) to form cyclobutane frameworks, followed by enantioselective synthesis or resolution steps using chiral catalysts, auxiliaries, or biocatalysis to obtain optically pure chiral cyclobutanes; midstream processing involves purification (distillation, crystallization, or chiral chromatography) and functionalization into derivatives (e.g., cyclobutyl amines, acids, or halides); downstream, these intermediates are supplied to pharmaceutical companies, agrochemical producers, and specialty chemical firms for incorporation into active ingredients, with final distribution handled through fine chemical suppliers and contract manufacturing organizations (CMOs) that provide custom synthesis and scale-up capabilities. In 2025, global Chiral Cyclobutane output was about 8,000 tons with 12,000 tons of capacity, average prices of USD 16,000-28,000 per ton, and gross margins around 39%.
