The global Chiral Vitamins market size is predicted to grow from US\$ 1804 million in 2025 to US\$ 2836 million in 2032; it is expected to grow at a CAGR of 6.7% from 2026 to 2032.

Chiral vitamins refer to vitamin molecules with defined stereochemistry, where different enantiomers or stereoisomers exhibit significant differences in biological activity, absorption efficiency, or safety; examples include naturally occurring bioactive forms and industrially produced high-purity chiral products via asymmetric chemical synthesis or biocatalysis, such as L-ascorbic acid (vitamin C), D-biotin, and active derivatives of vitamin B6; the core feature is that stereochemistry directly determines physiological function and market value, with industrial production exhibiting clear technological barriers and value stratification: high-end vitamins rely on stereoselective synthesis or enzyme-catalyzed production, while lower-end products may use racemates or mixtures, but the final bioactive component remains a defined chiral form. This segment combines nutritional enhancement, health functionality, and high added value, forming an independently quantifiable economic entity within the global vitamin supply chain.

This segment includes vitamins where stereochemistry determines bioactivity and production complexity, encompassing high-purity stereoselective forms and industrial-scale chiral vitamin raw materials. Implied demand volume is roughly 1,670-1,780 tonnes (derived from a blended ASP of ~USD\$10,350/kg). High-end active vitamins (e.g., pure vitamin D3, chiral B-vitamin derivatives) constitute ~18% of volume but ~45% of value; conventional chiral vitamins (e.g., L-ascorbic acid, riboflavin) ~62% of volume and ~40% of value; the remainder ~20% comprises other chiral vitamins such as active B6 derivatives. Pricing is tiered: high-end actives ~USD\$28,000-45,000/kg, conventional chiral vitamins ~USD\$15,000-22,000/kg, intermediate ~USD\$6,500-11,000/kg, producing a blended ASP ~USD\$10,350/kg and an industry gross margin ~47%. Downstream applications cover fortified nutrition

products, dietary supplements, and clinical/functional foods; upstream relies on fermentation and stereoselective synthesis technologies. The market structure exhibits coexistence of a small number of high-value products with several bulk chiral categories. Growth in 2026 is driven by rising health awareness, aging population nutrition needs, and expanded clinical use of active vitamins, with key uncertainties from feedstock cost fluctuations and regulatory tightening on health claims.
