Chitosan-based flocculant is a type of water treatment chemical that is derived from chitosan, which is a natural biopolymer extracted from crustacean shells. It is commonly used in wastewater treatment plants to remove suspended solids and contaminants from wastewater. The chitosan-based flocculant works by binding to suspended particles in the wastewater, causing them to clump together and settle out of the water. Chitosan-based flocculants have several advantages over traditional synthetic

flocculants. They are environmentally friendly, biodegradable, and non-toxic, making them ideal for use in water treatment applications. They also have excellent flocculation and coagulation properties, which make them effective at removing a wide range of contaminants from water.
