Chitosan is a partially deacetylated form of chitin; those commercially available have an average degree of acetylation of 10-30% and are prepared by treating chitin with a concentrated base at elevated temperatures. Chitosan also naturally occurs with varying degrees of acetylation and is often closely related to chitin. The predominantly deacetylated form is the major component of the cell wall of the zygomycete fungus, and in the squid pen, lobster, crab and *Rhodnius* it was also found that chitin showed a 10% deacetylated but undefined part. Chitosan complexes may be a widely occurring structural polymer.
