Chloramphenicol antibiotics are a class of antimicrobial agents that inhibit bacterial growth by targeting the bacterial ribosome. They work by binding to the 50S subunit of the bacterial ribosome, thereby interfering with protein synthesis. Chloramphenicol antibiotics exhibit broad-spectrum activity against a wide range of bacteria, making them effective in treating various bacterial infections. However, their use is often reserved for serious infections due to the potential for serious side effects, including bone marrow suppression. Despite these risks, chloramphenicol antibiotics remain an important therapeutic option in certain clinical settings where other antibiotics may be ineffective.
