A Chlorine Neutralisation System is a safety and environmental protection solution designed to eliminate or chemically neutralize chlorine in either gas or liquid form before it can pose a risk to people, equipment, or the environment. These systems are commonly used in industrial settings where chlorine is handled, such as water treatment plants, chemical manufacturing facilities, laboratories, and storage sites. Chlorine, while widely used as a disinfectant and chemical reagent, is highly toxic and corrosive; accidental leaks or excessive residual levels can be hazardous. Chlorine neutralisation systems work by converting chlorine into harmless compounds—typically through chemical reactions involving neutralizing agents like sodium bisulfite, sodium thiosulfate, or caustic soda, or by physical containment and scrubbing. Depending on the application, these systems may include gas scrubbers, liquid dechlorination units, or emergency containment devices, all designed to ensure regulatory compliance, workplace safety, and environmental protection.

United States market for Chlorine Neutralisation System is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
