The global Cholesteric Liquid Crystal (ChLCD) E-paper market size is predicted to grow from US$ 288 million in 2025 to US$ 1123 million in 2031; it is expected to grow at a CAGR of 25.5% from 2025 to 2031.

The impact of the latest U.S. tariff measures and the corresponding policy responses from countries worldwide on market competitiveness, regional economic performance, and supply chain configurations will be comprehensively evaluated in this report.

Common color e-paper technologies on the market include electrophoretic (EPD) and cholesteric liquid crystal (ChLCD). Electrophoretic (EPD) e-paper uses charged ink capsules to mix colors and is the mainstream technology for black-and-white e-book readers on the market. However, electrophoretic color e-paper can only present 4,000 different color levels at most by mixing four-color inks or color filters, which is far from the 16.78 million color levels of the product of 256 colors of red, green, and blue in the image file. Therefore, it has been unable to replace color LCD screens. Cholesteric liquid crystal technology (ChLCD) uses three layers of liquid crystal stacked together. Each layer of liquid crystal reflects red (R), green (G), and blue (B) respectively. Through the characteristics of bistable states, it can naturally exist in two stable states: in the planar state, the liquid crystal molecules are arranged neatly and can reflect light of a specific wavelength. In this state, the color of the reflected image can be seen. In the focal conic state, the arrangement of liquid crystal molecules allows light to penetrate. In this state, the color of the material under the liquid crystal layer can be seen. By independently changing the different states of the three layers of RGB liquid crystal, ChLCD can perfectly present 16.77 million rich colors, achieving the effect of 'true full color'. It is an important technology for using color e-paper to replace LCD and LED and other luminous displays.
