Cholesterol-lowering statins are a class of medications specifically designed to reduce elevated levels of cholesterol in the bloodstream, thereby lowering the risk of cardiovascular diseases. Statins are one of the most commonly prescribed cholesterol-lowering drugs. They work by inhibiting an enzyme involved in cholesterol synthesis in the liver. Some well-known statins include atorvastatin, simvastatin, and rosuvastatin.

Cholesterol-lowering statins are a widely marketed class of drugs used to treat high cholesterol and cardiovascular diseases globally. The market for these drugs is substantial, with sales steadily increasing, reflecting the growing concern and demand for cardiovascular health. In the future, the development prospects for statins are promising, and specific uses may expand into areas such as cardiovascular disease prevention and metabolic syndrome. Additionally, ongoing advancements in biotechnology are expected to drive the research and development of innovative drugs, enhancing treatment efficacy.
