The global Chopped and Milled Carbon Fiber market size is projected to grow from US\$ million in 2022 to US\$ million in 2029; it is expected to grow at a CAGR of % from 2023 to 2029.

Both chopped and milled carbon fiber offer excellent strength-to-weight ratio, stiffness, and corrosion resistance. They can be easily mixed or dispersed into various matrix materials, allowing for the creation of lightweight and strong composite materials with specific mechanical and performance characteristics.

Chopped and milled carbon fiber are two forms of carbon fiber material that are commonly used in various industries for their exceptional strength, lightweight properties, and high stiffness.

Chopped carbon fiber: Chopped carbon fiber consists of short lengths of carbon fiber strands or tows that have been cut into specified lengths. These strands are typically bound together using a binder material to form a loose fiber mat or a preformed shape. Chopped carbon fiber is often used as a reinforcement material in composite structures, where it provides strength and stiffness while reducing weight. It is commonly used in applications such as aerospace components, sports equipment, automotive parts, and wind turbine blades.

Milled carbon fiber: Milled carbon fiber is produced by grinding or milling continuous carbon fiber strands into fine particles. The resulting carbon fiber powder has a fine texture and can be mixed with various resins, polymers, or other materials to enhance

their mechanical properties. Milled carbon fiber is often used as a filler or additive in composites, coatings, adhesives, and plastics to improve strength, stiffness, and dimensional stability. It can also be used in applications that require lightweight and high-performance materials.
