The particle size of microspheres in analytical chromatography materials is usually 10 microns and below. They are mainly used for drug research and development analysis, quality control and preparation of small samples to achieve the separation of different components. Analytical chromatography products are mostly packed into columns. The chromatography column form exists. The chromatography column product is made by filling micron-sized stationary phase chromatography packing in a stainless steel or plastic Peek column tube using proprietary technology. The prepared chromatography column is connected to a liquid chromatography analysis instrument, that is Mixed components can be separated and various drug molecules analyzed. Chromatographic columns with excellent performance have high stable repeatability and long service life, which can save separation time and cost while ensuring better resolution and accuracy.
