The global Chromatography Grade Tetrahydrofuran market size is predicted to grow from US\$ 132 million in 2025 to US\$ 170 million in 2032; it is expected to grow at a CAGR of 3.7% from 2026 to 2032.

Chromatographic grade tetrahydrofuran refers to high-purity tetrahydrofuran products specifically designed for high-performance liquid chromatography (HPLC), gel permeation chromatography (GPC/SEC), liquid chromatography-mass spectrometry (LC-MS), and sample pretreatment analysis. This product undergoes multi-stage distillation, deep dehydration, peroxide control, and ultrapure filtration, resulting in extremely low levels of organic impurities, moisture, non-volatile residues, and UV absorption background. This effectively reduces chromatographic interference and improves the accuracy and repeatability of analytical results.

The upstream of the industry chain mainly includes 1,4-butanediol (BDO), industrial-grade tetrahydrofuran raw materials prepared by the maleic anhydride method or butadiene method, as well as distillation equipment, molecular sieve dehydration systems, peroxide control devices, high-purity packaging materials, and analytical instruments. The midstream involves the purification and packaging of chromatographic-grade tetrahydrofuran. Through multi-stage distillation, deep dehydration, ultrapure filtration, peroxide removal, and clean filling processes, industrial-grade THF is purified to a high-purity solvent product that meets the analytical requirements of HPLC, GPC/SEC, and UHPLC. The downstream is widely used in high-performance liquid chromatography (HPLC), gel permeation chromatography (GPC), and size exclusion chromatography (SEC) analytical systems, primarily serving polymer molecular weight determination, plastics and rubber material analysis, resin testing, polymer material research and development, pharmaceutical analysis, third-party testing institutions, and

university research laboratories.

In 2025, global sales of chromatographic grade tetrahydrofuran reached 6.52 million liters, with a production capacity of approximately 9.3 million liters, an average selling price of US\$20.7 per liter, and an average gross profit margin of 30%-40%.

With the development of high-performance materials, new energy materials, and advanced manufacturing industries globally, the demand for polymer analysis and testing continues to grow. Countries are increasingly emphasizing material performance verification, quality control, and R&D innovation, driving simultaneous growth in demand for GPC/SEC analytical equipment and high-purity THF. Meanwhile, because THF is a flammable and volatile organic solvent and poses a safety risk of forming peroxides, countries have established strict regulations for its storage, transportation, and laboratory use, prompting companies to continuously improve product safety and stability.
