Chromatography separation and purification media are specialized materials used in chromatography to isolate, identify, and purify individual components from complex mixtures. These media typically consist of solid or gel-like substances—such as silica, resins, or polymers—packed into columns or cartridges. They work by exploiting differences in chemical properties like size, charge, hydrophobicity, or affinity of molecules as they pass through the medium. Widely used in pharmaceuticals, biotechnology, environmental analysis, and food industries, these media are essential for producing high-purity compounds in both analytical and preparative scales.
