Chromhidrosis is a rare condition characterized by the secretion of colored sweat. There are two types of glands such as apocrine and eccrine gland. Apocrine glands secrete a milky sweat that, once fragmented down by bacteria, is the main cause of body odor whereas Eccrine glands secrete an odorless, clear fluid that serves to regulate body temperature. In addition, Chromhidrosis can be caused by various agents such as coloring agents used as food additives and this is anticipated to increase the demand for Chromhidrosis Treatment. There are three types of Chromhidrosis which includes Apocrine chromhidrosis, True eccrine chromhidrosis, Pseudo-eccrine chromhidrosis. Eccrine chromhidrosis can occur almost any place on the body as these glands are distributed with varying density throughout the skin except for the ear canal, prepuce, glans penis, clitoris, and lips and this is expected to increase the demand for Chromhidrosis treatment.
