Abstracts

The global Chromium-Free Basic Bricks market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Chromium-Free Basic Bricks are a type of refractory brick used in industrial furnaces and kilns. They are called 'chromium-free' because they do not contain chromium, which is often used in other types of refractory bricks for its high-temperature resistance properties. Instead, these bricks are made from materials such as alumina or magnesia, which provide good thermal shock resistance and can withstand the extreme temperatures found in industrial firing processes. They are commonly used in applications such as ceramics, glass, and steel manufacturing, where the absence of chromium is preferred for environmental and health reasons.

In the past, refractory bricks used in cement production were mainly chromium magnesia bricks, but there was a risk that some of the chromium would turn into toxic substances, which posed an environmental problem. In recent years, the use of waste and by-products as raw materials and fuel for cement has been increasing, and refractory bricks used in rotary kilns for cement are required to have better sulfur resistance and coating adhesion.
