The global Chronic Brain Damage Management market size is predicted to grow from US\$ 1039 million in 2025 to US\$ 1566 million in 2032; it is expected to grow at a CAGR of 6.1% from 2026 to 2032.

Chronic Brain Damage Management refers to an integrated disease-management system for long-term functional impairments caused by stroke, traumatic brain injury, intracerebral hemorrhage, hypoxic-ischemic brain injury, post-brain tumor surgery, and other central nervous system injuries. It includes continuous assessment, rehabilitation therapy, neuromodulation, medication support, cognitive training, motor function reconstruction, speech and swallowing intervention, emotional and behavioral management, nutritional support, complication prevention, and digital follow-up. Its product and service forms include rehabilitation robots, functional electrical stimulation devices, brain-computer interfaces, neuromodulation systems, intelligent assessment tools, imaging and electrophysiological testing, cognitive training software, remote rehabilitation platforms, assistive devices, and long-term care tools. The core value of this field lies in extending brain injury care from acute rescue to long-term functional recovery, quality-of-life improvement, and social reintegration, making it an important intersection of neurorehabilitation, chronic disease management, and digital health. The average gross profit margin of this product is 37%.

Chronic brain damage management is evolving from traditional rehabilitation therapy into a high-value market driven by neurological function reconstruction, long-term follow-up, home rehabilitation, and digital chronic disease management. Patients with stroke, traumatic brain injury, intracerebral hemorrhage, and hypoxic-ischemic brain injury often experience long-term motor impairment, cognitive decline, speech disorders, dysphagia, emotional and behavioral abnormalities, and limitations in daily living after acute

treatment, creating continuous and complex management needs. Policy systems continue to strengthen stroke prevention, rehabilitation service capacity, and disability prevention, pushing healthcare institutions to extend from saving lives to restoring function. With the development of rehabilitation robots, neuromodulation, functional electrical stimulation, intelligent assessment, remote rehabilitation, and AI-assisted training, chronic brain damage management is becoming a platform-based segment connecting neurology, rehabilitation medicine, intensive care, nursing institutions, and home-care scenarios. The core challenges of this industry lie in strong patient heterogeneity, long rehabilitation cycles, complex outcome assessment, limited payment capacity, and fragmented service systems. Patients with chronic brain damage differ significantly in etiology, lesion location, functional deficits, age, comorbidities, and family support, making it difficult for standardized products to fully meet individualized rehabilitation needs. Rehabilitation outcomes often require long-term training to become visible, placing high demands on patient adherence, therapist capability, device accessibility, and family support. At the same time, high-end rehabilitation robots, neuromodulation devices, and digital platforms require relatively high procurement investment, while payment capacity in primary institutions and home settings remains constrained. Future competition will not be limited to device performance, but will depend on clinical pathways, rehabilitation protocols, data loops, patient retention, service networks, and real-world evidence of effectiveness. Downstream demand is shifting from short-term inpatient rehabilitation toward a full-cycle model integrating hospital assessment, community continuation, home training, and remote management. Large hospitals and specialized rehabilitation institutions focus on motor function reconstruction, cognitive assessment, swallowing and speech training, neuromodulation, and multidisciplinary collaboration, aiming to improve training intensity, standardization, and outcome traceability through intelligent devices. Primary healthcare institutions, nursing facilities, and community rehabilitation centers need products that are easy to operate, low in maintenance cost, suitable for batch training, and capable of long-term follow-up. Home demand is gradually shifting from passive care toward active training, risk alerts, and improvement in daily living ability. As patient survival improves and rehabilitation awareness increases, chronic brain damage management will expand from single-point institutional services into a continuous management system covering hospitals, communities, homes, and digital platforms.
