Markers are broadly categorized as biomarkers or molecular markers and biochemical markers. Biomarker, also known as biological marker is commonly used to carry out detection of living organism which acts as a causative agent for specific diseases. It usually refers to a measurable indicator for various biological states or disease conditions in the human body. Biomarker is any substance that can be utilized as an indicator of specific disease condition and is often evaluated to detect pathogenic processes, normal biological process, or pharmacologic response to medical treatment. The elevated levels or absence of these biological markers may indicate the onset or late stage of a chronic disease. However, chronic phase indicates early stages of chronic leukemia which is a type of cancer in white blood cells. It constitutes high amounts of abnormal white blood cells in bone marrow and blood. Chronic phase

markers are the biomarkers that help in detection of a disease condition with the presence of their elevated levels in patient's body.
