The global CIPG FIPG Liquid Gasket market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

In industrial manufacturing, gasket seals are widely used in electronic and electrical components to prevent external impurities such as dust, moisture, corrosive media, etc. from invading the interior of machinery and equipment and causing damage to parts. Gasket seals occupy an important position in modern industrial enterprises. The quality of seals is directly related to the continuity of production, the safety of property, energy conservation and environmental protection, and people's physical and mental health. Therefore, the development of gaskets has attracted more and more attention. Gasket seals can be divided into two categories: solid gaskets and liquid gaskets. Traditional solid gaskets generally include copper gaskets, stainless steel gaskets, asbestos gaskets, rubber gaskets, etc. The advantages of solid gaskets are that they are cheap and easy to operate. The disadvantages are that the stock quantity is large, which is not conducive to inventory management, the shape and size need to be customized in advance, the flexibility is poor, and automated production cannot be achieved. Liquid gaskets are sealants. Liquid sealing is to apply adhesive to the flange surface to replace solid gaskets for bonding and sealing. Liquid sealants are fluid before curing, which can make the sealants fill the depressions and gaps between the bonding surfaces and eliminate the risk of interface leakage. After being sealed and cured, it has adhesion and will not cause leakage due to displacement, relaxation, creep and elastic fatigue damage. Therefore, liquid gaskets are an ideal sealing material and are widely used in lighting engineering, electrical and electronic industries, and electrical and automotive fields. In the automotive industry, they are used in sealed housings, motors, gearboxes and sensors. Liquid gaskets are divided into two process forms: CIPG and FIPG. The

CIPG process refers to the application of liquid sealant on the flange surface, which is generally heated and cured before assembly; the FIPG process refers to the application of liquid sealant on the flange surface, and the assembly of workpieces in an uncured state, and then it needs to be left for a period of time for the sealant to completely cure.

The market for CIPG and FIPG liquid gaskets is characterized by a growing demand for high-performance sealing solutions, driven by advancements in technology and increasing applications in industries such as automotive and aerospace. While challenges remain, particularly from traditional gaskets and regulatory complexities, the future outlook suggests continued growth and innovation in this segment.
