The global circRNA-LNP Formulation market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Circular RNAs (circRNAs) are covalently closed RNA molecules generated mainly from pre-mRNA back-splicing, and have also been found to function as mRNAs to direct protein synthesis inside cells. As a new generation of therapeutic mRNAs, circRNAs may address some of the limitations of linear mRNA including increased stability, reduced immunogenicity, and tissue/cell-specific translation. Therefore, translatable circRNAs are able to produce more therapeutic protein inside the body than conventional mRNA, with the potential to engineer cells, replace damaged proteins, or add new beneficial proteins for patients with serious diseases. LNPs have been proven to be an effective drug delivery system for RNA therapeutics which can be easily degraded in vivo. The lipid layer can fuse with the cell membrane, allowing the encapsulated RNA to enter the cell and exert its therapeutic effect. They also protect therapeutic agents from degradation and improve their bioavailability.

United States market for circRNA-LNP Formulation is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
