A circular polarizer is a combination of a linear polarizer and a  $\lambda/4$  wave retarder oriented at  $45^\circ$  that twists the light into a circular form. A ray of unpolarized light passing through the linear polarizer becomes polarized at  $45^\circ$  to the axis of the retarder. When this polarized light ray passes through the retarder, its vibration direction moves in a helical pattern. After the light ray is reflected from a specular surface, the sense of rotation of the vibration reverses. This rotation is then stopped and in return, sent through the retarder. The light ray is now linearly polarized in a plane  $90^\circ$  to its original polarisation plane, and is absorbed by the linearly polarized component of the circular polarizer.
