Circular RNA is a type of single-stranded RNA molecule with a special structure, which widely exists in different organisms. Unlike the classic linear RNA (linear RNA), circular RNA molecules have no 5' and 3' ends and are in a closed circular structure. Therefore it is not affected by RNA exonucleases and is more stable in vivo. It is a popular target for the treatment of human diseases. Its application potential is very great, and it has opened up a new idea for the field of biomedicine. Circular RNAs with clear functions can be used not only as biomarkers for the diagnosis of certain diseases, but also as therapeutic targets for some important diseases, especially immune diseases and cancers. They are widely used in infectious diseases, rare diseases, The treatment of blood diseases and tumors has both research and application value.
