Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Circulating Fluid Bed Boilers market.

Energy management is a worldwide project nowadays and in the foreseeable future. Boilers generate steam which is then used to provide space heat, process heat and other. Steam boiler is as an equipment used for generation of heat through the heat transfer from a working fluid or water. Air supply with high pressure lifts the material and coal particles and keeps it in suspension. The thermal energy from water is converted into electricity through passage of steam into turbines in power plants. Circulating Fluid bed boilers has given boilers and power plant operators a greater flexibility in burning wide range of coal and other fuels. The circulating fluidized bed is a clean process with the ability to achieve lower emission pollutants.

Factors such as wide fuel flexibility, excellent emission performance and large range of

load adjustment, CFB boiler technology developed rapidly and becomes one of the clean coal combustion technologies commercially applied in large scale operations. Surging demand for cost efficient and cleaner combustion technology coupled with stringent environmental regulations, has insisted to look for energy efficient ways of power generation.
