In 2024, global Circulating Grain Dryer production reached approximately 24121 units, with an average global market price of around K US$ 38 per unit. A circulating grain dryer is a type of agricultural machinery based on the principle of circulatory drying. Its operation involves loading wet grain into the machine, where an internal elevator and conveying system then move the grain in a closed-loop circulation path. During this cycle, the grain repeatedly passes through a fixed drying unit, undergoing intensive heat and mass transfer with the hot air medium, which causes water to evaporate and be carried away by the air stream. This process continues until the average moisture content of the entire batch is uniformly reduced to a pre-set safe storage level. Its core design aims to address the unevenness inherent in static drying through mechanical circulation, striking a balance between processing efficiency, drying quality, and equipment cost. It is particularly suitable for medium to small batches and for drying grain where quality is a priority.

United States market for Circulating Grain Dryer is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
