Circulating water pumps are crucial large auxiliary equipment in nuclear power plants (and almost all thermal power plants), but they do not directly participate in the core energy conversion cycle of the nuclear island or conventional island. Instead, they provide cooling for the entire power plant. Upstream raw materials include stainless steel, titanium alloys, and high-temperature alloys. Core components mainly include motors, seals, castings, and various forgings. Material quality directly determines the pump's lifespan and reliability. The core of the upstream industry lies in ensuring a reliable supply of cutting-edge materials and key components. Technologies for some top-performance special materials and high-end seals are still controlled by a few companies in developed countries. The midstream is the main battleground for technological competition, with the global market exhibiting a pattern of "international giants dominating, and leading companies from various countries vying for dominance." International manufacturers such as Flowserve (USA), KSB (Germany), Framatome (France), and Westinghouse (USA) hold important positions in the high-end market, especially in Europe and the US, thanks to their long-term technological accumulation and global layout. Chinese manufacturers, represented by state-owned enterprises
