The global Cis-Cyclopropane market size is predicted to grow from US\$ 71.41 million in 2025 to US\$ 96 million in 2032; it is expected to grow at a CAGR of 4.4% from 2026 to 2032.

Cis-Cyclopropane refers to cyclopropane derivatives in which substituents on the three-membered ring are positioned on the same side of the ring plane (cis configuration), leading to distinct stereochemical, reactivity, and biological properties compared to trans isomers; while unsubstituted cyclopropane itself has no cis/trans isomerism, the term is commonly used in substituted cyclopropanes (e.g., cis-1,2-disubstituted cyclopropanes) widely applied in pharmaceuticals, agrochemicals, and specialty intermediates. The supply chain begins upstream with petrochemical feedstocks such as ethylene, propylene, and halogenated hydrocarbons, which are converted into key intermediates like diazo compounds, carbenes, or haloalkanes; midstream production involves cyclopropanation reactions (e.g., Simmons-Smith reaction, metal-catalyzed carbene transfer, or intramolecular ring closure) under controlled stereoselective conditions to produce cis-configured cyclopropane derivatives, followed by purification (distillation, chromatography) and stereoisomer separation; downstream, cis-cyclopropane compounds are formulated into active pharmaceutical ingredients (APIs), crop protection chemicals (e.g., pyrethroids), and fine chemical building blocks, with distribution handled by specialty chemical manufacturers and custom synthesis providers supplying pharmaceutical, agrochemical, and advanced materials industries. In 2025, global Cis-Cyclopropane output was about 5,000 tons with 7,000 tons of capacity, average prices of USD 12,000-25,000 per ton, and gross margins around 32%.
