Abstracts

According to this study, the global Cladding (Metalworking) Service market size will reach US\$ 5304 million by 2031.

This report focus on Cladding (Metalworking) Service market. Cladding is the bonding together of dissimilar metals. It is different from fusion welding or gluing as a method to fasten the metals together. Cladding is often achieved by extruding two metals through a die as well as pressing or rolling sheets together under high pressure.

Laser cladding is a method of depositing material by which a powdered or wire feedstock material is melted and consolidated by use of a laser in order to coat part of a substrate or fabricate a near-net shape part (additive manufacturing technology) . It is often used to improve mechanical properties or increase corrosion resistance, repair worn out parts, and fabricate metal matrix composites. Surface material may be laser cladded directly onto a highly stressed component, i.e. to make a self-lubricating surface. The cladding service market is predicted to experience an upsurge in demand due to the growing number of deep-water and ultra-deep-water fields, as well as increasing drilling operations. This surge in demand is primarily driven by the oil and gas industry, which operates in a complex and challenging environment, particularly in terms of corrosion. With the discovery of new hydrocarbon sources in more challenging environments such as deeper reservoirs with higher temperatures and pressures, and containing greater concentrations of acid gases, these costs and environmental risks are expected to further increase in the upcoming years.
