The global Classical Swine Fever Live Vaccine market size is predicted to grow from US\$ 171 million in 2025 to US\$ 235 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

It is a type of vaccine for classical swine fever. Classical swine fever (CSF), also known as hog cholera, is a contagious viral disease of pigs, including wild boar. The causative virus is a member of the genus Pestivirus of the family Flaviviridae, and is closely related to the viruses of bovine viral diarrhoea and border disease. There is only one serotype of CSF virus (CSFV).

The Classical Swine Fever Live Vaccine market is primarily driven by the need to control and prevent the spread of the highly contagious and economically devastating hog cholera virus (classical swine fever). Vaccination plays a critical role in protecting swine populations and the pig farming industry from this deadly viral disease, which can result in high mortality rates and trade restrictions. The global demand for pork products also fuels the need to ensure the health and well-being of swine herds, making the hog cholera vaccine essential in maintaining a stable and profitable pork supply chain. However, the market also faces challenges, such as the emergence of new strains of the hog cholera virus, which may require the development of updated or novel vaccine formulations. Ensuring the efficacy and safety of vaccines against these evolving strains is crucial to maintain disease control measures. Additionally, the cost of vaccination programs and the accessibility of vaccines to pig farmers, especially in developing regions, can pose obstacles to widespread adoption. Addressing these challenges through continued research and development, international cooperation in disease monitoring, and government support in implementing effective vaccination programs will be essential to drive the growth of the hog cholera vaccine market and protect the swine

industry from this significant threat.
