The global Clean Methanol (Green Methanol and Blue Methanol) market size is predicted to grow from US\$ 2172 million in 2025 to US\$ 7310 million in 2032; it is expected to grow at a CAGR of 19.3% from 2026 to 2032.

Clean methanol encompasses methanol production methods with significantly lower greenhouse gas emissions compared to conventional methanol from natural gas. It includes two main categories: Green Methanol and Blue Methanol. Green Methanol is produced from renewable sources like biomass (biomethanol), renewable electricity and captured CO₂ (e-methanol). Blue Methanol is produced from natural gas with carbon capture and storage (CCS) technologies to mitigate CO₂ emissions. Both offer a pathway to reduce the carbon footprint of methanol used as a fuel or chemical feedstock.

The industry trend for clean methanol (both green and blue) is experiencing substantial growth driven by the global transition towards decarbonization and sustainable energy solutions. Increasing regulatory pressure to reduce greenhouse gas emissions across various sectors, including shipping, transportation, and chemicals, is a primary driver. In the shipping sector, the International Maritime Organization's (IMO) targets for emissions reduction are pushing the adoption of alternative fuels like methanol. In the transportation sector, the increasing focus on electric vehicles and alternative fuels is also contributing to the growing interest in methanol. The chemical industry is exploring the use of clean methanol as a sustainable feedstock for producing various chemicals and materials. Several factors are contributing to the increased adoption of clean methanol. Firstly, advancements in production technologies for both green and blue methanol are improving their efficiency and cost-competitiveness. Secondly, growing investments in renewable energy infrastructure and carbon capture technologies are

making these production pathways more feasible. Thirdly, increasing collaboration between industry players, including methanol producers, shipping companies, and technology providers, is facilitating the development of supply chains and bunkering infrastructure. While green methanol is considered the long-term sustainable solution, blue methanol is seen as a crucial transitional fuel that can be deployed more readily using existing natural gas infrastructure. The combination of both green and blue methanol is expected to play a vital role in the transition to a low-carbon economy.
