Clean room pass-through chambers, also known as airlocks or transfer hatches, are specialized enclosure systems used in controlled environments such as cleanrooms. They are designed to maintain the cleanliness and integrity of cleanroom environments while facilitating the transfer of materials and equipment between different areas.

The chambers typically consist of two interlocking doors, one on each side of the wall or partition separating the cleanroom from an adjacent area with a lower level of cleanliness. These doors are not opened simultaneously to prevent the direct flow of contaminants into the cleanroom.

Clean room pass-through chambers are constructed with materials that are compatible with cleanroom protocols, such as stainless steel or powder-coated steel, and are equipped with features to minimize particle generation and maintain air pressure differentials. They often incorporate high-efficiency particulate air (HEPA) filters or ultraviolet (UV) sterilization systems to further enhance cleanliness.

These chambers are used in various industries where cleanliness is critical, including pharmaceuticals, biotechnology, electronics manufacturing, and aerospace. They are

essential for transferring materials, components, tools, and products safely and securely between areas with different cleanroom classifications, thereby preventing contamination and maintaining the desired level of cleanliness throughout the facility.
