The global Cleanliness Testing Microscope market size is predicted to grow from US\$ 303 million in 2025 to US\$ 407 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

In 2025, the global production of cleanliness inspection microscopes reached 4,465 units, with an average price of approximately US\$69,400 per unit. The global annual production capacity of cleanliness inspection microscopes was approximately 6,350 units, with a gross profit margin of approximately 52.5%. A cleanliness inspection microscope is a type of microscopic imaging device used to observe and determine the 'cleanliness level' of material/component surfaces. It typically uses optical magnification (or combined with bright/dark field, polarized light, fluorescence, etc.) to magnify and display surface particles, stains, foreign objects, dust/debris, residues, etc., and then combines this with quantitative or semi-quantitative methods to complete the assessment. Common applications include: particle inspection in semiconductor and electronics manufacturing, surface cleanliness verification of medical devices/precision parts, and cleaning quality inspection of automotive and aerospace parts. Compared to ordinary magnifying glasses, it places greater emphasis on stable imaging, repeatable testing, and compatibility with testing standards/procedures (such as setting magnification, lighting conditions, image comparison, and statistical analysis). The upstream of cleanliness inspection microscopes includes objectives, CCD/CMOS sensors and motorized stages, the midstream consists of cleanliness inspection microscope manufacturers, and the downstream is mainly used in industries such as automotive and transportation, aerospace and defense, and medical and life sciences.
