The global Clinical Trial Adjudication Service market size is predicted to grow from US\$ 163 million in 2025 to US\$ 262 million in 2032; it is expected to grow at a CAGR of 7.2% from 2026 to 2032.

Clinical Trial Adjudication Service refers to the process of having independent experts review and make decisions on specific clinical trial data or events. This service is often used in research studies to ensure the accuracy and reliability of the trial results. Adjudicators are typically experts in the field related to the trial and are tasked with evaluating and resolving any discrepancies or uncertainties that may arise during the study. Their decisions help to maintain the integrity and credibility of the trial data, ultimately leading to more accurate and trustworthy results.

The Clinical Trial Adjudication Service industry is experiencing several notable trends. Firstly, there is a growing emphasis on the utilization of advanced technologies. The integration of artificial intelligence (AI) and machine learning (ML) is becoming more prevalent. These technologies can analyze vast amounts of complex clinical data much faster than human reviewers in some cases, helping to identify patterns, outliers, and potential trends. For example, AI algorithms can sift through patient records, biomarker data, and treatment outcomes to assist adjudicators in making more informed decisions. Secondly, there is a clear shift towards a more globalized approach. As pharmaceutical and biotech companies conduct clinical trials across multiple countries and regions, adjudication services need to adapt. This means dealing with diverse patient populations, different healthcare systems, and varying regulatory requirements. This globalization trend is further driven by the fact that many diseases, such as cancer and infectious diseases, are global health concerns, and having a unified approach to adjudication across different trial sites can lead to more comprehensive and

generalizable results. Another significant trend is the increasing demand for real-time adjudication. In the past, adjudication often occurred after a trial had been completed or at specific intervals. However, with the development of modern data collection and communication technologies, sponsors are now seeking real-time feedback on trial data. This allows for quicker identification of issues such as adverse events, protocol deviations, or emerging treatment effects. Real-time adjudication can also enable more agile trial design, as adjustments can be made during the course of the trial based on the immediate assessment of data.
