The global Closed Coke Slurry System (CCSS) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The Closed Coke Slurry System (CCSS) is a specialized technology used in petroleum refining processes to handle and transport solid coke produced during delayed coking operations. In the CCSS, the solid coke is suspended in a water-based slurry and transported through a closed-loop pipeline system from the coker drums to downstream processing units or storage facilities. This closed system minimizes environmental emissions, reduces dust pollution, and eliminates the need for traditional coke handling methods such as open-air stockpiles or truck transport. Additionally, the CCSS offers operational advantages such as improved safety, reduced maintenance, and enhanced efficiency in handling and processing solid coke residues generated during petroleum refining operations.
