The global Closed-Loop Feedback Phase-Locked Loop market size is predicted to grow from US\$ 2827 million in 2025 to US\$ 4456 million in 2032; it is expected to grow at a CAGR of 6.8% from 2026 to 2032.

A closed-loop feedback phase-locked loop is a control system that generates an output signal whose phase is related to the phase of an input signal. Its function is to synchronize the circuit output signal with its external reference signal. When the frequency or phase of the reference signal changes, the phase-locked loop will detect this change and adjust the output frequency through its internal feedback system until the two are synchronized again.
