The global Closed Type Ultrasonic Sensors market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Ultrasonic sensor is a device that uses ultrasonic waves (waves with a frequency higher than 20 kHz) for measurement and detection. It works by emitting ultrasonic pulses and receiving signals reflected back from obstacles. According to the propagation time, frequency changes, or other characteristic changes of ultrasonic signals, ultrasonic sensors can determine the position, distance, velocity, and even the characteristics of objects. Closed ultrasonic sensors use the piezoelectric principle to receive and transmit ultrasonic signals by utilizing the piezoelectric and inverse piezoelectric effects of piezoelectric chips. The distance between the sensor and the detection target is calculated based on the transmission time of the ultrasonic signal.
