According to this study, the global Cloud Managed Networking market size will reach US\$ 18010 million by 2031.

Cloud-managed networking is a way of managing and controlling a business network remotely through resources in the cloud, rather than from onsite network controllers or management software. It uses a SaaS model to make it easy to control and analyse on-premise network devices, such as wireless access points and switches.

The rise in demand for cloud networking in order to improve productivity and simplify the deployment of the application is projected to drive the cloud managed networking market. Managed cloud networking platform simplifies networking by reducing complexity and cost of distributed deployments of organization. Cloud networking creates an opportunity for companies to reduce capital expenses on IT networking resources. However, all data transmitted on cloud network is likely to pose a threat of confidential information leakage, security, and privacy issues for companies. This, in turn, is expected to restrain the cloud managed networking market. Several solution providers create opportunities by offering services to developers to create, run, manage, and deploy applications for both on-premises and public cloud environment. Companies are expected to adopt managed cloud platform with advanced features such as hosting, elastic computing, relational database (SQL), object storage, and artificial intelligence. These features are expected to set a new trend in cloud computing application.
