The global Cloud-Native Intrusion Protection Software market size is predicted to grow from US\$ 1233 million in 2025 to US\$ 4060 million in 2032; it is expected to grow at a CAGR of 18.7% from 2026 to 2032.

Cloud-native intrusion prevention software (IPM) is a security solution specifically designed for cloud environments and containerized applications. It aims to detect, prevent, and respond to various cyberattacks and security threats. This software provides comprehensive security protection through real-time monitoring, behavioral analysis, and threat intelligence, ensuring that data, applications, and infrastructure in the cloud environment are protected from malicious attacks and unauthorized access, guaranteeing the secure operation of cloud-native applications and business continuity.

The cloud-native IPM industry chain is primarily built around cloud security and network protection technologies. Upstream includes cloud computing infrastructure providers, operating system and container platform vendors, and security chip and hardware acceleration module suppliers, providing the runtime environment and underlying technical support for IPM. Midstream consists of core IPM developers and cloud security service providers, responsible for developing firewalls, threat detection, abnormal behavior analysis, vulnerability protection, and automated response functions, while also providing SaaS or hybrid cloud deployment solutions. Downstream comprises enterprise users, government agencies, and various internet service providers who directly deploy and use the protection software to defend against cyberattacks and data breaches. In terms of overall gross profit margin, the gross profit margin of upstream infrastructure is relatively low, generally between 10% and 25%; the gross profit margin of midstream intrusion prevention software development and cloud security services is relatively high, usually between 50% and 70%; and the gross profit margin of

downstream implementation and operation and maintenance services is relatively moderate, about 20% to 40%, mainly affected by labor costs and customized services.

Cloud-native intrusion prevention software represents the focus and innovation on security in the cloud computing era. It is not only a tool to deal with network threats, but also an indispensable part of cloud-native architecture. These software provide enterprises with strong security, enabling them to deploy applications in the cloud with confidence and remain forward-looking and agile in the evolving threat environment. By combining advanced threat detection technology and automated response mechanisms, cloud-native intrusion prevention software helps enterprises protect their critical assets, maintain their reputation, and increase confidence in business continuity. As digital transformation and cloudification trends continue to advance, the value of these software will become more prominent and become an important part of enterprise security strategy.
