CNC Continuous Generating Gear Grinding Machines, also referred to as threaded-wheel gear grinding machines, are high-precision CNC machine tools designed for the hard finishing of gears after heat treatment. The core process uses a threaded grinding wheel, or grinding worm, synchronized with the workpiece spindle to generate the final tooth flank geometry of external gears, selected internal gears, shaft gears, disc gears and gear shafts. A typical machine integrates a rigid machine bed, grinding spindle, workpiece spindle, multi-axis CNC control, dressing system, automatic indexing and alignment, coolant filtration, measurement and compensation software, and optional loading automation. These machines are primarily used in the production of automotive transmission gears, electric-drive gears, robot reducer gears, precision planetary gears, industrial gearbox gears, construction machinery gears and aerospace transmission components. Their value lies in stable high-volume production, high tooth accuracy, improved flank surface quality, optimized flank modification, reduced transmission noise and enhanced load-carrying performance.
