Carbon Nanotube (CNT) heating film refers to a thin film made up of a network of carbon nanotubes that can generate heat when an electric current is passed through it. Carbon nanotubes are cylindrical structures made of carbon atoms arranged in a repeating hexagonal pattern. CNT heating films harness the electrical and thermal conductivity properties of carbon nanotubes to produce efficient and uniform heating.

The carbon nanotubes in the film act as highly conductive pathways for electrical current. When a voltage is applied to the film, the current flows through the nanotubes, causing them to heat up due to Joule heating. This phenomenon occurs as electrical resistance within the nanotubes leads to the conversion of electrical energy into thermal energy. The heat generated by the film is then transferred to the surrounding environment, making it suitable for various heating applications.

CNT heating films provide a versatile and efficient heating solution with applications in Construction Building, New Energy Vehicles, Smart Wear, Aerospace and Defense, Medical Equipment, Smart Agriculture, and various other industries. Their unique properties make them ideal for applications requiring fast, uniform, and controllable heat generation.

The global CNT Heating Film market size is projected to grow from US\$ 57.9 million in 2024 to US\$ 126 million in 2030; it is expected to grow at a CAGR of 13.8% from 2024 to 2030.
