The global Co-Extruded (COEX) Tubes market size is predicted to grow from US$ 143 million in 2025 to US$ 211 million in 2032; it is expected to grow at a CAGR of 5.9% from 2026 to 2032.

Co-Extruded (COEX) Tubes are advanced packaging structures created by extruding multiple polymer layers together into a single seamless tube, combining the unique properties of each material to achieve optimal performance. This design allows for tailored characteristics such as flexibility, durability, barrier protection, and chemical resistance, making them suitable for demanding applications in industries like pharmaceuticals and cosmetics, etc. By integrating different materials into a unified structure, co-extruded tubes provide enhanced product protection, extended shelf life, and improved user convenience while maintaining an efficient and cost-effective manufacturing process.

The supply chain for co-extruded tubes begins upstream with the sourcing of raw materials, primarily specialized polymers such as polyethylene, polypropylene, and barrier resins, which are supplied by petrochemical and polymer manufacturers along with colorants, adhesives, and additives for customization. Midstream, the manufacturing process involves advanced co-extrusion and tube-forming technologies where multiple layers are combined into seamless structures, followed by printing, labeling, and finishing to meet brand and regulatory requirements. Downstream, the finished tubes are supplied to industries such as pharmaceuticals, cosmetics, personal care, and food, where they are filled, distributed, and delivered to end-users through established packaging and retail networks. When orders reach several thousand units, the price per tube is approximately $0.06-$0.10, with a gross profit margin of 20% to 35% and a capacity utilization rate of 65% to 85%.
