The global Co-NTA Resin market size is predicted to grow from US\$ 41.09 million in 2025 to US\$ 73.44 million in 2032; it is expected to grow at a CAGR of 8.5% from 2026 to 2032.

Co-NTA resin is a metal chelate affinity chromatography medium in which NTA chelating groups are immobilized on agarose, magnetic agarose, or other porous supports and pre-loaded with Co²⁺ ions. It is primarily used for the capture, purification, and small-scale preparation of His-tagged recombinant proteins. The gross margin is approximately 60%.

Co-NTA resin represents a high-purity niche within His-tag protein purification consumables. Its overall market size is significantly smaller than that of Ni-NTA resin but maintains stable demand in research laboratories, early-stage biopharmaceutical development, structural biology, and protein-protein interaction studies. Its core value lies in the relatively higher selectivity of cobalt ions for histidine tags, which reduces host contaminants, weakly bound proteins, and background band interference. Therefore, it is often used for recombinant protein samples requiring higher purity and lower nonspecific binding.

From the demand side, Co-NTA resin is mainly driven by recombinant protein expression, antigen preparation, enzyme engineering, antibody fragment research, and proteomics validation experiments. Most users adopt Co-NTA as a "cleaner but slightly lower-capacity" alternative alongside Ni-NTA for difficult-to-purify proteins, downstream functional experiment samples, or detection systems sensitive to background. Magnetic Co-NTA products also benefit from small-volume, high-throughput, and automated sample processing needs, making them suitable for 96-well plates, small-scale screening, and parallel purification of multiple samples.

In terms of competition, these products are supplied by international life science reagent companies, chromatography medium manufacturers, and some domestic biotech reagent firms. Leading brands excel in matrix stability, batch-to-batch consistency, metal ion leakage control, and complementary buffer systems, while domestic suppliers compete mainly on price, delivery speed, and localized application support. Future growth is unlikely to come from large-scale industrial protein purification replacement but will come from continued repurchase in research and early development, as well as the adoption of magnetic beads, pre-packed columns, and high-throughput product formats. Overall, Co-NTA resin is a small but stable, high-unit-price, mid-technical-barrier specialty affinity purification consumable.
