Co-processed MCC & CMC-Na is a composite excipient made by combining microcrystalline cellulose (MCC) and sodium carboxymethyl cellulose (CMC) through a special process. In water, this co-processed compound first swells and dissolves due to the sodium carboxymethyl cellulose, causing the microcrystalline cellulose particles to disintegrate and form a stable, high-quality suspension.The upstream core raw materials are high-purity cellulose and sodium carboxymethyl cellulose. Downstream applications are mainly in the pharmaceutical industry, particularly in the production of suspensions and dry suspensions for poorly soluble drugs, providing excellent stability and suspending ability.

Global sales in 2024 were approximately 7,000 tons, with an average market price of approximately US$5,930 per ton. The size of a single production line varies depending on the production process and investment scale. Industry gross profit margins range from 20% to 35%.
