Insufflator is the device used for check and surgery of ventral and heart of the body. Insufflator generally employs carbon dioxide (CO<sub>2</sub>) to generate and maintain the intraperitoneal gas in order to expand the operative field. A insufflator delivers carbon dioxide under low pressure to open up a space within the body, usually to allow a sufficiently large viewing area during endoscopy. According to the USA FDA's regulation, "a laparoscopic insufflator is a device used to facilitate the use of the laparoscope by filling the peritoneal cavity with gas to expand it". An insufflator usually consists of host, verses needle, gas (such as CO<sub>2</sub>) filter, heating unit and power line etc.
