The global CO₂ Mineralization market size is predicted to grow from US\$ 414 million in 2025 to US\$ 822 million in 2032; it is expected to grow at a CAGR of 10.5% from 2026 to 2032.

CO₂ mineralization technology is a carbon capture and utilization (CCU) process that converts captured carbon dioxide into stable, solid carbonates by reacting it with naturally occurring or industrially sourced minerals, such as calcium or magnesium silicates. This process mimics natural weathering but accelerates it under controlled conditions. The resulting carbonates are environmentally stable and can be used in construction materials like concrete, thereby permanently sequestering CO₂ while providing valuable byproducts. CO₂ mineralization is a promising approach for reducing greenhouse gas emissions and mitigating climate change, especially when integrated with industrial processes.

United States market for CO₂ Mineralization is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
