According to our (LP Info Research) latest study, the global CO2 Mineralization Technology market size was valued at US\$ million in 2022. With growing demand in downstream market and recovery from influence of COVID-19 and the Russia-Ukraine War, the CO2 Mineralization Technology is forecast to a readjusted size of US\$ million by 2029 with a CAGR of % during review period.

The research report highlights the growth potential of the global CO2 Mineralization Technology market. With recovery from influence of COVID-19 and the Russia-Ukraine War, CO2 Mineralization Technology are expected to show stable growth in the future market. However, product differentiation, reducing costs, and supply chain optimization remain crucial for the widespread adoption of CO2 Mineralization Technology. Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the CO2 Mineralization Technology market.

CO2 mineralization technology, also known as CO2 mineral carbonation or CO2 mineral storage, is a process that involves capturing carbon dioxide (CO2) emissions and converting them into stable mineral forms. This approach aims to permanently store CO2 by transforming it into solid carbonate minerals through chemical reactions.

In CO2 mineralization, CO2 is typically captured from industrial flue gases or other sources, such as direct air capture. The captured CO2 is then reacted with a mineral-rich feedstock, commonly referred to as a feedstock or mineral reactant, which contains metal oxides like calcium or magnesium. These metal oxides react with CO2 to form

solid carbonates.

Action is currently being taken globally to mitigate global warming. The objective of reducing CO₂ emissions is not a burden for society but is a significant opportunity for evolution in various industries for the sustainable production of energy and the essential minerals, metals, and materials required for modern society. CO₂ mineralization is one of the most promising methods to effectively reduce CO₂ emissions via the formation of stable mineral carbonates.
