The global Coalescent Oil Separator market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Agglomerated oil separator is a device that utilizes the principle of agglomeration to efficiently separate oil from mixed fluids. The working principle of the agglomerated oil separator is mainly based on the agglomeration and separation of oil. When the mixed fluid enters the separator, it passes through a specially designed filter medium (e.g. highly pure glass fibers) and the oil agglomerates into large particles on the surface of the medium. These large particles are then separated from the fluid by gravity or centrifugal force and deposited at the bottom of the separator. At the same time, clean fluid is discharged from the outlet of the separator, realizing effective separation of oil.
