The global Coated Micron Diamond Powders market size is predicted to grow from US\$ 83.15 million in 2025 to US\$ 127 million in 2032; it is expected to grow at a CAGR of 6.3% from 2026 to 2032.

Coated micron diamond powders are synthetic diamond particles uniformly coated with metallic layers such as nickel or titanium to enhance bonding strength, thermal stability and wear resistance in demanding polishing and cutting applications. Their key advantages include improved adhesion to tool matrices, higher impact resistance, reduced particle shedding and significantly longer service life compared with uncoated diamond, making them ideal for precision abrasives, cutting tools and semiconductor processing. In 2024, production was approximately 1,053 tons, and the average price was USD 76,000 per ton. The industry's capacity utilization rate in 2024 was about 60%, and the average gross margin was roughly 36%. Upstream, the most critical inputs include graphite and jet milling equipment, supplied by companies such as GrafTech and Hosokawa. The midstream segment focuses on diamond synthesis or selection, micronization, precision classification, particle shaping and controlled metal coating processes that determine coating thickness, uniformity and performance. Downstream, coated micron diamond powders are used in abrasives, polishing products, cutting tools and semiconductor manufacturing, with representative companies such as 3M, Saint-Gobain, Sandvik, Intel and TSMC applying them in high-performance grinding wheels, CMP systems, and precision wafer processing.

The market outlook for coated micron diamond powders is highly favorable as precision manufacturing continues shifting toward materials and processes that demand longer tool life, higher cutting stability and more consistent polishing performance. Metal-coated diamonds offer superior bonding strength and thermal resistance, enabling

higher processing speeds and reduced tool wear in applications such as semiconductor wafer thinning, CMP systems, precision grinding and high-performance cutting tools. As workpiece materials trend toward harder and more brittle substrates, including ceramics, sapphire and wide-bandgap semiconductors, the advantages of coated diamond—particularly its reduced particle shedding and enhanced impact resistance—become increasingly critical. With ongoing advancements in coating uniformity, surface engineering and micron-level particle control, coated micron diamond powders are expected to experience sustained growth and become an indispensable material supporting next-generation electronic, optical and mechanical manufacturing.
